

[Document Name] Abstract

[Abstract]

[Problem to be Solved] To provide a data extraction supporting system and so on which focuses attention on repetitive behavior
5 of a person to extract information that the person actually remembers or really wants.

[Solution] An extraction candidate data deciding/transmitting means 84 of a data extraction supporting device 4 decides extraction candidate data corresponding to
10 history corresponding data for each user, reads the extraction candidate data from the information database 90 and transmits the extraction candidate data to a user terminal 6 on condition that the history corresponding data satisfies a transmission decision criterion. A history corresponding data updating
15 means 86 receives information about whether or not the extraction candidate data transmitted to the user terminal 6 and displayed on the user terminal 6 were selected by the user and updates the history corresponding data based on the received information. An extraction data deciding means 88 decides
20 extraction candidate data corresponding to the history corresponding data as extraction data for the user on condition that the updated history corresponding data satisfies a specific extraction decision criterion.
